

C. Claims

1. (Currently Amended) A biochemical reaction cartridge, comprising:
a reaction portion, comprising a chamber and a passage, for effecting a
biochemical reaction, and

a solution storage portion, which is ~~isolated or~~ separated from said reaction
portion, for storing a solution in a position corresponding to the chamber,

wherein ~~said cartridge is provided with a penetrable partition member
disposed between~~ said solution storage portion ~~[[and]]~~ is superposed on said reaction
portion at a time of use, so ~~as to move~~ that the solution is moved from said solution
storage portion to ~~the chamber of~~ said reaction portion through a penetrable partition
member.

2. (Currently Amended) A cartridge according to Claim 1, wherein a
valve stem can penetrate said partition member ~~through which a valve stem can penetrate~~ by
pushing.

3. (Original) A cartridge according to Claim 2, wherein the chamber is
opened outward by a first-stage pushing of the valve stem with a tool needle to move the
solution in said solution storage portion to the chamber, and is sealed up by a second-stage
pushing of the valve stem with the tool needle.

4. (Original) A cartridge according to Claim 3, wherein said partition member is provided with two pressing rods including a shorter pressing rod for use in the first-stage pushing and a longer pressing rod for use in the second-stage pushing.

5. (Original) A cartridge according to Claim 4, wherein the shorter and longer pressing rods are coaxially disposed opposite from each other.

6. (Currently Amended) A cartridge according to Claim 1, wherein said cartridge has a code for representing information on a treatment sequence including ~~[[the]]~~ an order of penetration of said partition member.

7. (Currently Amended) A cartridge according to Claim 1, wherein said cartridge has an identification code for representing ~~[[the]]~~ a type of cartridge.

8. (Currently Amended) A biochemical treatment process which uses a biochemical reaction cartridge comprising a reaction portion including at least one chamber and a plurality of passages, a solution storage portion including a plurality of storage chambers, which are ~~isolated or~~ separated from the reaction portion, for storing a solution in a positions corresponding to said at ~~least~~ least one chamber, and at least one penetrable partition member disposed between the solution storage portion and the reaction portion, wherein the solution storage portion is superposed on the reaction portion at a time of use,

so that the solution is moved from the solution storage portion to said reaction portion through a corresponding penetrable partition member; said process comprising:

a first step of moving a solution from an associated storage chamber to a corresponding chamber of the reaction portion by penetrating said at least one partition member,

a second step of effecting a treatment with the solution moved to the chamber of the reaction portion,

a third step of moving a solution in a storage chamber other than the chamber from which the solution is moved in said first step by selectively penetrating at least one second partition member other than the partition member used in said first step, and

a fourth step of effecting treatment with the solution moved to the storage chamber in said third step.

9. (Currently Amended) A process according to Claim 8, wherein said cartridge has a code for representing information on a treatment sequence including the order of penetration of said partition members.

10. (Currently Amended) A process according to Claim 8, wherein said cartridge has an identification code for representing the type of cartridge.

11. (Currently Amended) A biochemical treatment apparatus,
comprising:
an accommodation unit in which a biochemical reaction cartridge comprising
a reaction portion, comprising at least one chamber and at least one passage, for effecting a
biochemical reaction, and a solution storage portion, which is ~~isolated or~~ separated from the
reaction portion, for storing a solution in a position corresponding to said at least one
chamber, is mounted, wherein the solution storage portion is superposed on the reaction
portion at a time of use, so that the solution is moved from the solution storage portion to
the reaction portion through a penetrable partition member,
driving means for driving penetration means for penetrating a partition
member of the biochemical reaction cartridge mounted in said accommodation unit, and
reaction treatment means for causing a reaction of a specimen in the
biochemical reaction cartridge by acting on the biochemical reaction cartridge,
wherein said biochemical treatment apparatus further comprises control
means for successively driving said drive means and said reaction treatment means.

12. (Original) An apparatus according to Claim 11, wherein the
penetration means is provided in the biochemical reaction cartridge.

13. (Original) An apparatus according to Claim 11, wherein the
penetration means is provided to the biochemical treatment apparatus.

14. (Currently Amended) An apparatus according to Claim 11, wherein the biochemical treatment apparatus further comprises code reading means for reading an identification code provided to the biochemical reaction cartridge.

15. (Currently Amended) An apparatus according to Claim 14, wherein the biochemical treatment apparatus further comprises memory means for memorizing a driving sequence of said drive means in advance ~~[[in]]~~ corresponding to the identification code.
